Secure Global Desktop Object Manager

Object Manager lets you:

- **Create and configure objects** representing the people, hosts, applications and documents within your organization.
- **Define webtops** for all users of Secure Global Desktop, and see whose webtop any object is on.
- **Monitor who's running which applications** on which application servers, and shadow or end those application sessions.
- **Find out who's cached passwords** for which application servers, and delete password cache entries.

Use the Finder pane on the left to look for the objects you want to work with. Properties for objects appear in place of this text.

Tips:

- You can drag objects and drop them on tabs in the Properties pane.
- You can right-click an object for options.
